# Approximation for extinction probability of the contact process based on the Gröbner basis

# Norio Konno Department of Applied Mathematics Yokohama National University

**Abstract**. In this note we give a new method for getting a series of approximations for the extinction probability of the one-dimensional contact process by using the Gröbner basis.

### 1 Introduction

Let  $X = \{0,1\}^{\mathbb{Z}^d}$  denote a configuration space, where  $\mathbb{Z}^d$  is the d-dimensional integer lattices. The contact process  $\{\eta_t : t \geq 0\}$  is an X-valued continuous-time Markov process. The model was introduced by Harris in 1974 [1] and is considered as a simple model for the spread of a disease with the infection rate  $\lambda$ . In this setting, an individual at  $x \in \mathbb{Z}^d$  for a configuration  $\eta \in X$  is infected if  $\eta(x) = 1$  and healthy if  $\eta(x) = 0$ . The formal generator is given by

$$\Omega f(\eta) = \sum_{x \in \mathbb{Z}^d} c(x, \eta) [f(\eta^x) - f(\eta)],$$

where  $\eta^x \in X$  is defined by  $\eta^x(y) = \eta(y) \, (y \neq x)$ , and  $\eta^x(x) = 1 - \eta(x)$ . Here for each  $x \in \mathbb{Z}^d$  and  $\eta \in X$ , the transition rate is

$$c(x, \eta) = (1 - \eta(x)) \times \lambda \sum_{y:|y-x|=1} \eta(y) + \eta(x),$$

with  $|x| = |x_1| + \cdots + |x_d|$ . In particular, the one-dimensional contact process is

$$001 \rightarrow 011$$
 at rate  $\lambda$ ,  
 $100 \rightarrow 110$  at rate  $\lambda$ ,  
 $101 \rightarrow 111$  at rate  $2\lambda$ ,  
 $1 \rightarrow 0$  at rate  $1$ .

Let  $Y = \{A \subset \mathbb{Z}^d : |A| < \infty\}$ , where |A| is the number of elements in A. Let  $\xi_t^A(\subset \mathbb{Z}^d)$  denote the state at time t of the contact process with  $\xi_0^A = A$ . There is a one-to-one correspondence between  $\xi_t^A(\subset \mathbb{Z}^d)$  and  $\eta_t \in X$  such that  $x \in \xi_t^A$  if and only if  $\eta_t(x) = 1$ . For any  $A \in Y$ , we define the extinction probability of A by  $\lim_{t\to\infty} P(\xi_t^A = \emptyset)$ . Define  $\nu_\lambda(A) = \nu_\lambda\{\eta : \eta(x) = 0$  for any  $x \in A\}$ , where  $\nu_\lambda$  is an invariant measure of the process starting from a configuration:  $\eta(x) = 1$  ( $x \in \mathbb{Z}^d$ ) and is called the *upper invariant measure*. In other words, let  $\delta_1 S(t)$  denote the probability measure at time t for initial probability measure  $\delta_i$  which is the pointmass  $\eta \equiv i(i = 0, 1)$ . Then  $\nu_\lambda = \lim_{t\to\infty} \delta_1 S(t)$ . Then self-duality of the process implies that  $\nu_\lambda(A) = \lim_{t\to\infty} P(\xi_t^A = \emptyset)$ . The correlation identities for  $\nu_\lambda(A)$  can be obtained as follows:

**Theorem 1.1** For any  $A \in Y$ ,

$$\lambda \sum_{x \in A} \sum_{y:|y-x|=1} \left[ \nu_{\lambda}(A \cup \{y\}) - \nu_{\lambda}(A) \right] + \sum_{x \in A} \left[ \nu_{\lambda}(A \setminus \{x\}) - \nu_{\lambda}(A) \right] = 0.$$

From now on we consider the one-dimensional case. We introduce the following notation:

$$\nu_{\lambda}(\circ) = \nu_{\lambda}(\{0\}), \ \nu_{\lambda}(\circ\circ) = \nu_{\lambda}(\{0,1\}), \ \nu_{\lambda}(\circ\times\circ) = \nu_{\lambda}(\{0,2\}), \ \ldots$$

By Theorem 1.1, we obtain

#### Corollary 1.2

- $(1) 2\lambda\nu_{\lambda}(\circ\circ) (2\lambda+1)\nu_{\lambda}(\circ) + 1 = 0,$
- (2)  $\lambda \nu_{\lambda}(\circ \circ \circ) (\lambda + 1)\nu_{\lambda}(\circ \circ) + \nu_{\lambda}(\circ) = 0,$
- (3)  $2\lambda\nu_{\lambda}(\circ\circ\circ) + \nu_{\lambda}(\circ\times\circ) (2\lambda+3)\nu_{\lambda}(\circ\circ\circ) + 2\nu_{\lambda}(\circ\circ) = 0,$
- (4)  $\lambda \nu_{\lambda}(\circ \circ \times \circ) (2\lambda + 1)\nu_{\lambda}(\circ \times \circ) + \lambda \nu_{\lambda}(\circ \circ \circ) + \nu_{\lambda}(\circ) = 0.$

The detailed discussion concerning results in this section can be seen in Konno [2, 3]. If we regard  $\lambda, \nu_{\lambda}(\circ), \nu_{\lambda}(\circ \circ), \nu_{\lambda}(\circ \circ \circ), \ldots$  as variables, then the left hand sides of the correlation identities by Theorem 1.1 are polynomials of degree at most two. In the next section, we give a new procedure for getting a series of approximations for extinction probabilities based on the Gröbner basis by using Corollary 1.2. As for the Gröbner basis, see [4], for example.

#### 2 Our results

Put  $x = \nu_{\lambda}(\circ)$ ,  $y = \nu_{\lambda}(\circ\circ)$ ,  $z = \nu_{\lambda}(\circ\circ\circ)$ ,  $w = \nu_{\lambda}(\circ\times\circ)$ ,  $s = \nu_{\lambda}(\circ\circ\circ)$ ,  $u = \nu_{\lambda}(\circ\circ\times\circ)$ . Let  $\prec$  denote the lexicographic order with  $\lambda \prec x \prec y \prec w \prec z \prec u \prec s$ . For m = 1, 2, 3, let  $I_m$  be the ideals of a polynomial ring  $\mathbb{R}[x_1, x_2, \ldots, x_{n(m)}]$  over  $\mathbb{R}$  as defined below. Here  $x_1 = \lambda, x_2 = x, x_3 = y, x_4 = z, x_5 = w, x_6 = s, x_7 = u$  and n(1) = 3, n(2) = 4, n(3) = 7.

#### 2.1 First approximation

We consider the following ideal based on Corollary 1.2 (1):

(5) 
$$I_1 = \langle 2\lambda y - 2\lambda x - x + 1, y - x^2 \rangle \subset \mathbb{R}[\lambda, x, y].$$

Here  $y-x^2$  corresponds to the first (or mean-field) approximation:  $\nu_{\lambda}^{(1)}(\circ \circ) = (\nu_{\lambda}^{(1)}(\circ))^2$ . Then

(6) 
$$G_1 = \{(x-1)(2\lambda x - 1), y - x^2\}$$

is the reduced Gröbner basis for  $I_1$  with respect to  $\prec$ . Therefore the solution except a trivial one x(=y)=1 is  $x=\nu_{\lambda}^{(1)}(\circ)=1/(2\lambda)$ . Remark that the trivial solution means that the invariant measure is  $\delta_0$ . From this, we obtain the first approximation of the density of the particle,  $\rho_{\lambda}=E_{\nu_{\lambda}}(\eta(x))$ , as follows:

(7) 
$$\rho_{\lambda}^{(1)} = 1 - \nu_{\lambda}^{(1)}(\circ) = \frac{2\lambda - 1}{2\lambda},$$

for any  $\lambda \geq 1/2$ . This result gives the first lower bound  $\lambda_c^{(1)}$  of the critical value  $\lambda_c$  of the one-dimensional contact process, that is,  $\lambda_c^{(1)} = 1/2 \leq \lambda_c$ . However it should be noted that the inequality is not proved in our approach. The estimated value of  $\lambda_c$  is about 1.649.

#### 2.2 Second approximation

Consider the following ideal based on Corollary 1.2 (1) and (2):

$$I_2 = \langle 2\lambda y - 2\lambda x - x + 1, \lambda z - \lambda y - y + x, xz - y^2 \rangle \subset \mathbb{R}[\lambda, x, y, z].$$

Here  $xz-y^2$  corresponds to the second (or pair) approximation:  $\nu_{\lambda}^{(2)}(\circ)\nu_{\lambda}^{(2)}(\circ\circ) = (\nu_{\lambda}^{(2)}(\circ\circ))^2$ . Then

$$G_2 = \{(x-1)((2\lambda - 1)x - 1), 1 + 2\lambda(y-x) - x, -y - yx + 2x^2, -z - y(2+y) + 4x^2\}$$

is the reduced Gröbner basis for  $I_2$  with respect to  $\prec$ . Therefore the solution except a trivial one x(=y=z)=1 is  $x=\nu_{\lambda}^{(2)}(\circ)=1/(2\lambda-1)$ . As in a similar way of the first approxamation, we get the second approximation of the density of the particle:

$$\rho_{\lambda}^{(2)} = \frac{2(\lambda - 1)}{2\lambda - 1},$$

for any  $\lambda \geq 1$ . This result implies the second lower bound  $\lambda_c^{(2)} = 1$ . We should remark that if we take

$$I_2' = \langle 2\lambda y - 2\lambda x - x + 1, \lambda z - \lambda y - y + x, y - x^2, z - x^3 \rangle \subset \mathbb{R}[\lambda, x, y, z],$$

then we have

$$G_2' = \{z - 1, y - 1, x - 1\}$$

is the reduced Gröbner basis for  $I_2'$  with respect to  $\prec$ . Here  $y-x^2$  and  $z-x^3$  correspond to an approximation:  $\nu_{\lambda}^{(2')}(\circ\circ) = (\nu_{\lambda}^{(2')}(\circ))^2$  and  $\nu_{\lambda}^{(2')}(\circ\circ\circ) = (\nu_{\lambda}^{(2')}(\circ))^3$ , respectively. Then we have only trivial solution: x=y=z=1.

# 2.3 Third approximation

Consider the following ideal based on Corollary 1.2 (1)–(4):

$$I_3 = \langle 2\lambda y - 2\lambda x - x + 1, \lambda z - \lambda y - y + x,$$
  

$$2\lambda s + w - (2\lambda + 3)z + 2y, \lambda u - (2\lambda + 1)w + \lambda z + x,$$
  

$$ys - z^2, xu - yw \rangle \subset \mathbb{R}[\lambda, x, y, z, w, s, u].$$

Here  $ys-z^2$  and xu-yw correspond to the third approximation:  $\nu_{\lambda}^{(3)}(\circ\circ)\nu_{\lambda}^{(3)}(\circ\circ)=(\nu_{\lambda}^{(3)}(\circ\circ\circ))^2$  and  $\nu_{\lambda}^{(3)}(\circ)\nu_{\lambda}^{(3)}(\circ\circ\times\circ)=\nu_{\lambda}^{(3)}(\circ\circ)\nu_{\lambda}^{(3)}(\circ\times\circ)$ , respectively. Then

$$G_3 = \{(x-1)((12\lambda^3 - 5\lambda - 1)x^2 - 2\lambda(2\lambda + 3)x - \lambda + 1), \ldots\}$$

is the reduced Gröbner basis for  $I_3$  with respect to  $\prec$ . Therefore the solution except a trivial one x=1 is  $x=\nu_{\lambda}^{(3)}(\circ)=(\lambda(2\lambda+3)+\sqrt{D})/(12\lambda^3-5\lambda-1)$ , where  $D=16\lambda^4+4\lambda^2+4\lambda+1$ . Then we obtain the third approximation of the density of the particle:

(8) 
$$\rho_{\lambda}^{(3)} = \frac{4\lambda(3\lambda^2 - \lambda - 3)}{12\lambda^3 - 2\lambda^2 - 8\lambda - 1 + \sqrt{D}},$$

for any  $\lambda \geq (1+\sqrt{37})/6$ . This result corresponds to the third lower bound  $\lambda_c^{(3)} = (1+\sqrt{37})/6 \approx 1.180$ .

# 3 Summary

We obtain the first, second, and third approximations for the extinction probability, the density of the particle, and the lower bound of the one-dimensional contact process by using the Gröbner basis with respect to a suitable term order. These results coincide with results given by the Harris lemma (more precisely, the Katori-Konno method, see [3]) or the BFKL inequality [5] (see also [3]). As we saw, the generators of  $I_m$  in Section 2 have degree at most two in  $x_1, x_2, \ldots$ , such as  $2\lambda y - 2\lambda x - x + 1$ ,  $ys - z^2$  in the case of  $I_3$ . We expect that this property will lead to get the higher order approximations of the process (and other interacting particle systems having a similar property) effectively.
